# SPECIFICATION

## GENERAL

Transmitter.....Crystal controlled PLL synthesizer, amplitude modulation  
 Receiver.....Crystal controlled double conversion, superheterodyne system  
 Communicating frequency.....40 CB channels (26.965 to 27.405 MHz)  
 Voltage operation.....12-16V DC (negative ground)  
 Temperature and Humidity range.....-22°F ~ +140°F (-30°C ~ +60°C) at 10% ~ 90%  
 Transmitter/ Receiver switching.....Electrical

## STANDARD TEST CONDITIONS

Battery supply voltage.....13.8V DC  
 Modulation.....1000 Hz, 30%  
 Receiver output power.....500mW at external SP  
 Receiver output impedance.....8 ohms, non-inductive  
 ANT. load impedance of transmitter.....50 ohms, non-inductive  
 Ambient conditions  
   Temperature.....63°F ~ +73°F (17°C ~ 23°C)  
   Humidity.....40% ~ 70%

## TRANSMITTER

Description	Nominal	Limit
RF power output.....	4.0 watts	3.6~4.4 watts
Antenna spurious emission.....	70 dB	60 dB
Modulation capability (positive/ negative).....	+90%/-90%	+80%/-80%
AMC Range at 1 KHz.....	40 dB	30 dB
Frequency accuracy.....	±300 Hz	±500 Hz
Spurious accuracy & Harmonic		
Signal radiation ratio from fundamental.....	-65 dB	-60 dB
Current consumption		
at no modulation.....	1000 mA	1100 mA
at 80% modulation.....	1500 mA	1900 mA
Envelope distortion.....	10% max. 1000 Hz, 50% mod.	
Stability variation against antenna impedance.....	Satisfactory when dummy antenna is varied from 40 ohms to 200 ohms.	

## RECEIVER

Description	Nominal	Limit
Intermediate frequency		
1st IF.....	10.695 MHz	
2nd IF.....	455 KHz	
Sensitivity at 10 dB (S+N)/N.....	0.5 $\mu$ V	1.0 $\mu$ V
Adjacent channel rejection.....	40 dB	60 dB
Image rejection (1st IF/ 2nd IF).....	70 dB	60 dB
IF rejection ratio (1st IF/ 2nd IF).....	70 dB	60 dB
Signal-to-Noise ratio at 1mV input.....	45 dB	5%
Distortion at 1mV input, 30% mod. (500 mW output).....	2%	75 dB
Power output at 1mV input		
Undistorted (10% THD).....	4.0W	3.0W
Maximum.....	5.0W	4.0W
Electrical fidelity compared to 1000 Hz		
450 Hz.....	-6 dB	-6 dB $\pm$ 6 dB
2500 Hz.....	-6 dB	-6 dB $\pm$ 6 dB
Cross modulation.....	50 dB	40 dB
Squelch.....	1000 $\mu$ V	250~4000 $\mu$ V
Current consumption at no signal.....	200 mA	100 mA

## OTHER ITEMS

Fuse.....	1 Amps/ 250V
General power requirement.....	12-16V DC
Dimensions.....	109(W) X 33(H) X 162(D) milliliter
Weight.....	1 lbs 7 ozs (0.65 kg)

**Note:** Nominal specs represent the design specs. All units should be able to approximate these-some will exceed and some may drop slightly below these specs. Limit specs represent the absolute worst condition that still might be considered acceptable; in no case should a unit fail to meet limit specs.

# OPERATING INSTRUCTIONS

Having properly installed and wired your new CB and connected the antenna, you are now ready to adjust your radio for optimum reception and voice transmission.

1. Insert the microphone cord plug into the microphone jack(mic). Push inward and tighten the locking nut provided on the end of the cord. When removing the microphone, unscrew the locking nut and pull out the microphone plug.

2. Turn the power "ON".

3. Set to the desired channel.

4. Adjust the squelch control knob to reduce any undesirable background noise when no signal is being received. To do this, select a channel where no signals are present, or wait until signal ceases on your channel. Then rotate the squelch control knob to a point where the background noise ceases.

Note: When the squelch is set properly, the speaker will remain quiet until a signal is received. In order to receive weak signals, do not squelch too high.

5. Adjust the volume to the desired listening level.

6. To connect an optional external speaker, locate the external speaker jack on the rear of the unit and insert the speaker plug into the jack. The radio's speaker will be disconnected when an external speaker is engaged.

## To Transmit/To Receive

Press and hold the push-to-talk bar. Speak slowly and clearly in a normal voice, two to three inches from the microphone. A built-in modulation control circuit will automatically adjust the microphone input level. There is no need to speak loudly. To Receive-release the push-to-talk bar.

## PA System and optional PA speaker Operation

To use the public Address system feature, you must install a remote mounted (outside of the vehicle) PA speaker(not supply). After the speaker is installed and wiring completed to the rear panel of the radio insert the speaker's wire connector plug into the "PA-Speak" jack. To activate the PA system, manually switch from the "CB" mode to the "PA" mode. At this time you will no longer be able to send, or receive CB transmission. You are now ready to broadcast through the PA system using the radio's microphone and the volume control. When finished, switch back to the "CB" mode.

# THEORY OF OPERATION

## 1. INTRODUCTION

The transmitter frequency and the receive first and second local oscillator are all derived from a signals 10.240 MHz crystal by means of a phase locked loop.

The transmitter frequency is from 26.965 MHz with first local oscillator is fixed at 10.240 MHz to yield a second IF at 455 MHz.

During transmit the VCO of the PLL operates from 13.4825 MHz (CH.1) to 13.7025 MHz (CH.40)

The VCO frequency is doubler Q11, which doubles the frequency to yield 26.965 MHz (CH.1) to 27.405 MHz (CH.40).

The VCO operating frequency of the receiver oscillates 16.270 MHz (CH.1) to 16.710 MHz (CH.40) as the first local oscillator. And is injected through buffer AMP Q601 into first mixer Q103.

## 2. BASIC SYNTHESIS SCHEMATIC

The crystal frequency (10.240 MHz) is divided by 4096 to yield 2.5 KHz which is fed to one side the phase detector. The VCO output is divided by a programmable divider. And fed to other side the phase detector. The feedback loop is closed by passing the phase detector output thru an active low pass filter and using the output to control the VCO frequency thru varicap D601. The net result is a second order phase locked loop.

Under locked condition. The frequency to both sides of phase detector must be identical at 2.5 KHz. The VCO frequency is then given by:

$$F_{VCO} / N = 0.0025 \text{ MHz} \quad \text{or} \quad F_{VCO} = 0.0025 * N \text{ MHz}$$

Since N is integer, The VCO frequency can be stepped up in 2.5 KHz increment. By suitable choice of the desired output frequency are obtained.

	CHANNEL 1		CHANNEL 40	
	N	FVCO	N	FVCO
TRANSMIT	5393	13.4825	5481	13.7025
RECEIVE	3254	16.2700	3342	16.7100

(SEE TABLE 1 FOR OTHER CHANNELS)

The VCO frequency is doubler input which then doubles the frequency.

	VCO OUTPUT FREQUENCY	DOUBLER OUTPUT FREQUENCY
TRANSMIT	CH 1 , 13.4825 MHz	26.965 MHz
TRANSMIT	CH 40 , 13.7025 MHz	27.405 MHz

For the first local oscillation, the buffer amp output is supplied. Since all frequencies are obtained from the crystal oscillator by linear processed all outputs are coherent with the crystal oscillator frequency and maintain the same percentage accuracy.

**PROGRAM DATA & FREQUENCY (TABLE 1)**

### 3. DETAILED DESCRIPTION

(SEE FREQUENCY SYNTHESIZER BLOCK DIAGRAM AND SCHEMATIC)

#### (1) INSTRUCTION

The synthesizer is implemented with the following components;

- PLL IC (IC1)
- X-TAL (X1)
- Varactor Diode (D601)
- LED Display (LED)

IC1 is a COMS LSI that includes most of PLL block the VCO with varicap diode D601 as part of the oscillator tank circuit. Q602 is a switching transistor to connect or disconnect the tuning capacitor C609 in the VCO oscillator tank circuit for transmitter or receiver.

#### (2) Reference Frequency

The crystal, X1(10.240 MHz) and other components at Pin 9 and of IC1 form an oscillator with an amplifier internal to IC1.

#### (3) VCO

Q603 is connected as a hartley type oscillator with varicap diode as part of the tank circuit. With appropriate control voltage on D601, the VCO can be made to oscillate over the required range of 13.4825 MHz to 16.710 MHz

#### (4) Programmable Divider and Its Control

The programmable inputs (7-segment code) are fed to pins 1 to 7 IC1. The programmable input consists of a 7-segment code to light channel indicator LED (LED Display). For CH. 1 "b" and "c" of the LED element of LED display will light. The programmable input "b" goes low to produce CH.1 device (RX:N=3254, TX:N=5393)

For each channel number input an internal code converter provides the appropriate binary control to the programmable divider for that channel. Since the binary number required is different during transmit and receive, an additional bit is required at pin 18 of IC1 to allow the rom to recognize the TX/RX status. Pin 22 is internally tied to plus 5 volts which is the receive status.

During transmit the pulse to talk switch rounds pin 22 thru diode (D12,D13) which is the transmit status.

The programmable divider output is fed to the phase detector for comparison with the 2.5 KHz reference. See table 1 for actual input and device ratio on all channels.

#### (5) Phase Detector and Control

The phase detector is a digital phase comparator which compares the leading edges of the reference with programmable divider output square waves and develops a series of pulses whose DC level depends on the phase error is leading. The phase detector pulse output is fed to a charge pump and then to pin 16 of IC1. The charge pump output is fed to an active low pass filter which consists of R20,R608,C20 and the amplifier between pin 14 and 15 of IC1. The low pass filter output at pin 14 of IC1 is further filtered and fed to varicap D601 control the VCO frequency.

The result is a second order PLL with loop dynamics essentially controlled by the active low pass filter.

#### (6) Transmit/Receive, Buffer AMP

The VCO output is fed into buffer AMP Q601 from the secondary of L4.

#### (7) Transmitter Doubler

The Q603 output is obtained as emitter follower output tank circuit is double transistor Q11. At this stage, the frequency is doubled. Q11 output tank circuit is double tuning circuit (27MHz) L5 and L6 to stop the 13.5 MHz frequency.

#### (8) Switching of Tuning Capacitor in VCO Oscillator Tank Circuit

The VCO circuit must tune with a wide range of frequencies 13.4825~13.7025 MHz for transmitter and 16.27 MHz~16.710 MHz for receiver. The use of one tuning capacitor in common has adverse effects as a decrease in C in the tuning circuit and the occurrence of many spurious signals. To eliminate these effects, the tuning capacitance is switched for transmission or reception. The circuit consists of the primaries of L4, C602, C609. When receiving Q602 becomes off. So, primary of L4, and make tuning function.

When transmitting, Q602 becomes on. So the primary of L4 and the parallel capacitance of C603 and C609 make tuning function.

#### (9) Receiver Local Oscillator Outputs

##### First Mixer:

The secondary output of VCO tank circuit L4 is injected through buffer AMP Q601 and the emitter follower output through the base of 1st mixer Q103.

##### Second Mixer:

The oscillation output oscillated with 10.240 MHz crystal X1 across pin9 and 10 of IC1 is output from pin9 and injected into the base of Q201.

### 4. FREQUENCY STABILITY

LET : FO = Crystal Oscillator Frequency

FR = Phase Detector Reference

FVCO = VCO Frequency

FT = Transmit Frequency

THEN : FR = FO/4096

and under locked conditions : Fr = VCO / N

where N is the programmable divider ration.

THEN : FVCO = N = FR = N(FO/4096)

From which it can be seen that the percentage error in FT is the percentage error in FO. The stability of the oscillator is determined primarily by the crystal and to a lesser extent by the active and passive components of the oscillator.

He choice of crystal and components is such that the required stability is maintained over the required voltage and temperature range.

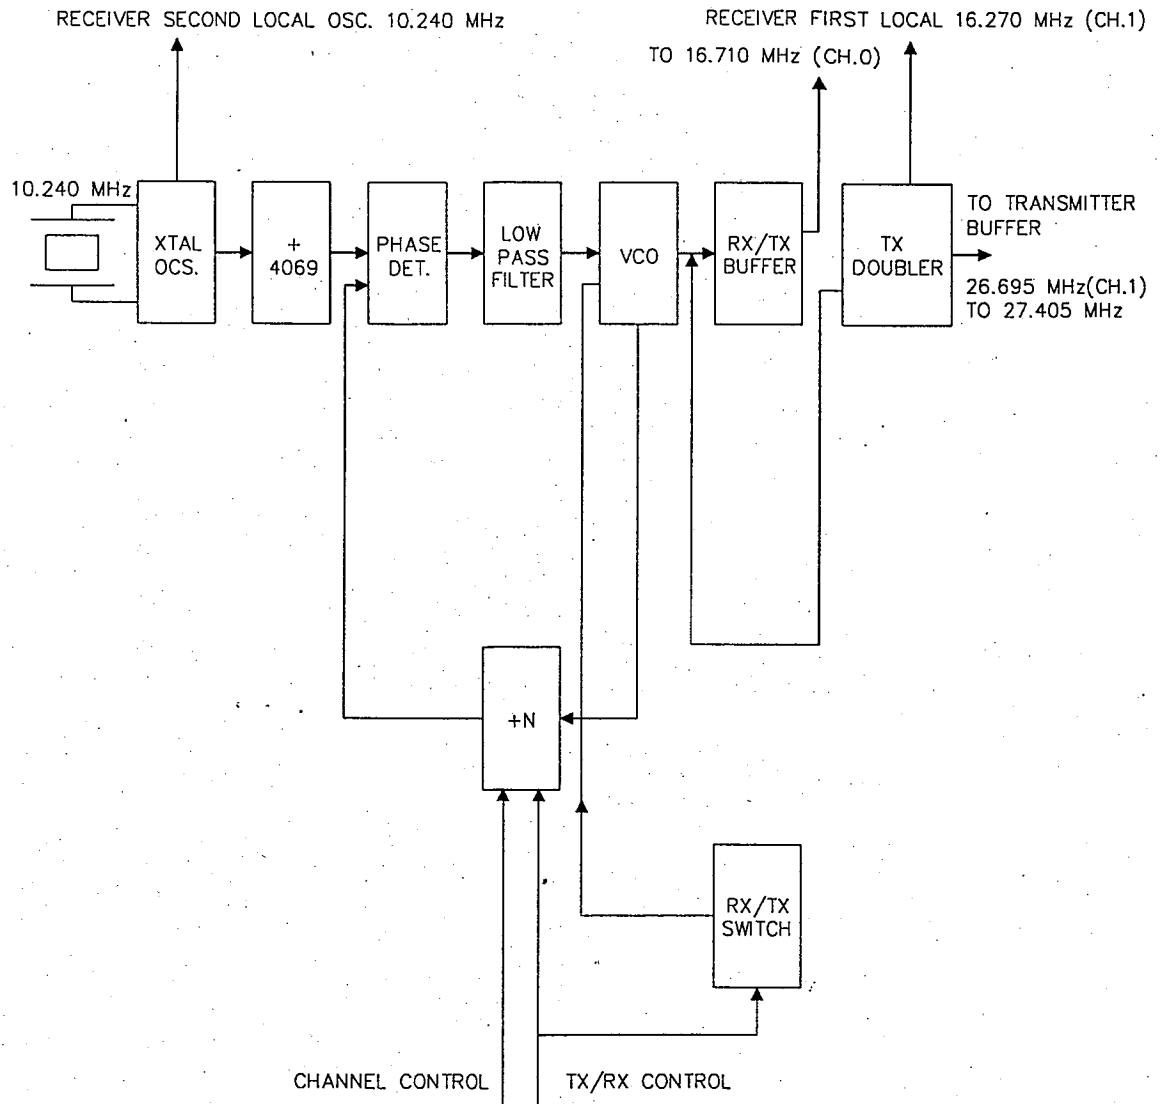

#### Receiver

The receiver is a double conversion super heterodyne with the first IF at 10.965 MHz and the second IF at 455 KHz. The synthesizer local oscillator 10.965 MHz below the receiver frequency and the second local oscillator at 10.240 MHz.

The detector output provides AGC to all previous stage except Q204.

Squelch is controlled by Q10.

# TEST EQUIPMENT SETUP AND ALIGNMENT INSTRUCTIONS

## 1. PHASE LOCKED LOOP AND CPU SECTION

### A. Test Equipment Required

- Frequency Counter
- DC Power Supply
- DC Voltmeter
- Oscilloscope

### B. Alignment Procedure

Step	Setting	Connection	Adjust	Adjust for
1	Frequency adjustment — MIC: Receive Volume: Optional Squelch: Optional CH Selector: Optional	Frequency counter to output pin 19 of IC1 (Figure 1).	C512	10.240 MHz $\pm$ 100 Hz
2	RX VCO voltage adjustment — MIC: Receive Volume: Optional Squelch: Turn Clockwise CH Selector: 1	Connect DC voltmeter between R514 and RF516 (Figure 2).	L6	2.5 V
3	TX VCO voltage adjustment — MIC: Transmit Volume: Optional Squelch: Optional CH Selector: 1	Connect DC voltmeter between R514 and RF516 (Figure 2).	L6	Indication on DC voltmeter must be 2~2.5 volt. If DC voltmeter does not indicate 2~2.5 volt, readjust L6.

Figure 1

Figure 2

## 2. Transmitter Section

### A. Test Equipment Section

- RF Power Meter (RF SSVM)
- 50 ohm load (non-inductive)
- RF Attenuator
- Oscilloscope
- Audio generator
- DC power supply
- Spectrum analyzer
- Frequency counter
- Coupler

### B. Alignment Procedure

Step	Setting	Connection	Adjust	Adjust for
1	RF driver stage — MIC: Transmit Volume: Optional Squelch: Optional CH Selector: 19	Connect RF power meter to base of Q13 (Figure 3).	L7 L8	Maximum indication on the RF power meter.
2	RF power stage — MIC: Transmit Volume: Optional Squelch: Optional CH Selector: 19	Connect dummy load and RF power meter to the EXT-ANT jack on the set (Figure 4).	L9 L12	Maximum indication on the RF power meter (4 watts). If indication is not in 4 watts range, go back to step 1 and readjust L9, L12.
3	Modulation adjustment — MIC: Transmit Volume: Optional Squelch: Optional CH Selector: 19	Connect audio generator (1 KHz) to pin 4 of microphone jack (Figure 5). Connect dummy load and oscilloscope through coupler to RF power meter. Connect RF power meter to EXT-ANT jack on the set. Adjust audio signal level to obtain 80%~90% of the modulation level.	RV2	Proper modulation pattern on the oscilloscope.
4	Second harmonic check — MIC: Transmit Volume: Optional Squelch: Optional CH Selector: 19	Connect the input terminal of RF power meter to the EXT-ANT jack on the set through the -40dB attenuator and the output terminal to the spectrum analyzer through the dummy load/coupler (Figure 6).		At no modulation, compare the level of fundamental frequency to the level of harmonic frequency. Suppression of the 2nd harmonic frequency level must be lower than -60dB. Check for the other channels.
5	Frequency check — MIC: Transmit Volume: Optional Squelch: Optional CH Selector: 19	Connect dummy load and frequency counter through coupler to RF power meter. Connect RF power meter to EXT-ANT jack on the set (Figure 7).	C512	Be sure that the indication of the transmitter frequency is 27.185 MHz $\pm$ 300 Hz on the frequency counter.
